ABOUT

I'm a software developer focused on cloud-native systems and information security, building backends designed to stay secure under real load. I use AI tools every day to get into unfamiliar codebases fast, modernize aging stacks, and ship features quickly. Open to remote work.

AI-DRIVEN DEVELOPMENT

- **Reading unfamiliar code:** I map systems I've never seen in days instead of weeks: endpoints, shared state, what calls what. Code nobody could explain becomes readable again.
- **Modernizing aging stacks:** I've shipped framework upgrades, runtime moves, and cross-stack ports, all rolled out strangler-fig style with characterization tests covering the old behavior.
- **Shipping features:** I join projects mid-quarter and ship the next feature or two as vertical slices, reviewed commit by commit, without breaking what already works.
- **Custom agents & workflows:** I wire task-specific sub-agents into a team's dev cycle, built per project: CI review that catches what lint can't (convention and architecture drift), PR comments that read like a senior reviewer's, debugging from logs, traces, and metrics, and codebase-wide refactors.

WORK EXPERIENCE

Backend Developer & DevOps

Jan 2024 – Present

Freelancing

Remote

- Built RESTful APIs and backend services in Node.js, shaped around each client's business logic.
- Delivered AI-assisted legacy modernization for client codebases: framework upgrades, runtime moves, and cross-stack ports. Parallel AI coding agents took on the slow work; architecture and final review stayed mine.
- Built custom automation by integrating AI-powered APIs for text processing, data enrichment, and intelligent routing.
- Improved platform performance and reliability by integrating AWS CloudFront, Redis, Sentry, and CloudWatch.
- Dockerized services and managed 20+ servers on AWS and DigitalOcean, keeping availability high.
- Shipped a high-volume PDF generation service on AWS Lambda with Puppeteer, producing large PDFs from aggregated client sources.
- Used Cloudflare across client projects (DNS, CDN, WAF, Workers, KV, Pages) for serverless services, application security, and global content delivery.

Backend Engineer

Sep 2025 – Jun 2026

Ayris Global (Part-Time)

Remote

- Built the virtual card provisioning backend for Assure PAT: test cards issue in under 30 seconds, support 1,000+ reuses, and return to inventory automatically when a test finishes.
- Integrated AWS KMS in a zero-knowledge design so testers never see raw PAN or CVV data, with encryption across card lifecycle events and sensitive data flows.
- Implemented audit logging across card events, provisioning actions, and transactions, putting every action on the record for compliance, traceability, and certification.

- Designed the shared card access backend for Ayris Pay, letting cardholders share spending access with family or team members without exposing the primary card credentials.
- Added data residency and localization controls so transaction processing met regional regulatory requirements in each target market.

Backend Developer

Ananta Security Lab

Jan 2024 – Feb 2025

Gujarat, India

- Maintained and scaled a client's high-traffic on-demand food delivery platform.
- Conducted security audits and compliance assessments for multiple clients.
- Built a real-time attendance system around high-speed face recognition, tracking personnel and producing analytics on presence, punctuality, and historical trends.
- Developed a computer vision pipeline that extracts digital meter readings from images with a custom-trained OCR model, automating data collection.
- Prototyped integrations for new AI technologies in existing products, with fast iteration from idea to proof of concept.

Backend Developer

Rbian Infotech

Jan 2022 – Dec 2023

Gujarat, India

- Built scalable backend services for high-traffic cloud environments with Node.js, TypeScript, MongoDB, and PostgreSQL.
- Provisioned and managed core AWS infrastructure: EC2, load balancers, VPC, RDS, and S3.
- Introduced a Git-based documentation system that made collaboration easier and cut onboarding time for new engineers.
- Migrated a legacy ES5 codebase to TypeScript and added Jest tests, making the code easier to maintain and faster to work in.
- Set up and troubleshoot CI/CD pipelines with code review built in, automating deployments.
- Standardized the team's dev environments with Docker and devcontainers, and set up linters and shared rules for code quality.

EDUCATION

Atmiya University

Bachelor of Science in Information Tech

Gujarat, India

2019 – 2022

TECHNICAL SKILLS

Technologies: Golang, TypeScript, Python, Node.js, Deno, Git, Linux, AWS, GCP, Docker, MongoDB, PostgreSQL, MySQL, Redis, WebSockets, Socket.IO, CI/CD, GitHub Actions, AI/ML API Integration

Interests: Information Security, Cloud Computing, DevOps, Serverless, Distributed Systems, Open Source
